# HERRY HILL NURSERY

5 1-2 miles from Newburyport.

2 1-2 miles from Byfield Depot.

1 1-2 miles from West Newbury Electric Road

WEST NEWBURY, MASS.

#### T. C. THURLOW, Proprietor

In presenting another Annual Trade List, I would state that our stock this spring is generally large and fine—in some respects better than ever before.

I would call particular attention to our large and well-grown stock of Sugar and Norway Maples, Am. Elms, Hardy Magnolias, new and choice Shrubs—Evergreens (especially White Spruce, the finest we ever grew), Pines, Firs, Junipers, and the new hardy Rocky Mountain Evergreens—no better anywhere.

I would also state that I design to materially reduce my acreage of large trees and shrubs, and in future *make a specialty* of small stock, as Pæonies, Iris, Phlox, Hardy Rhododendrons, Azaleas, Andromedas, Kalmias, etc. Of these we now have an immense stock of small plants, and hope soon in this department to be able to compete with any grower in this country or Europe.

We use no glass whatever, and everything offered on our different circulars is expected to be perfectly acclimated (unless otherwise noted), and well adapted to the climate of the New England and Middle States, and the lower Provinces of Canada. As our expenses are quite moderate, we are able to offer first-class stock at low prices. Our soil is the best, being generally a strong loam underlaid with clay, suitable for producing healthy trees and shrubs with the best of roots.

## Advice to Purchasers.

34 34 34

In spring we usually commence digging and packing the first week in April, though evergreens and other stock where the ground is shaded cannot be dug till later.

EARLY ORDERS (before April 1st) are very essential to successful tree planting. The nurseryman, if he knows what orders to depend upon, can engage a large force of men, and dig to much better advantage, just as soon as the frost is out, before the sap goes up and the buds are swollen, and if the trees are not wanted for immediate

planting, they can be heeled in and left till the ground is ready to receive them; but the earlier they are planted after the ground is dry the better. Probably three-fourths of all the losses in spring are on account of too late planting. Sometimes, especially those with a ball of earth, or a mass of fibrous roots, like the Rhododendrous, the Azalea or the Magnolia, can be planted safely up to the first of June, while others like the Purple Beech, the Larch, Dormant Roses, Currants, Gooseberries, Raspberries, etc., must be planted early in spring, or in the fall. So, friends, please attend to it at once, and send your orders early, and we will try and send the stock early, but remember that during the busy season we cannot dig large trees at a minute's notice. The early orders must be attended to first. There is a mistaken notion that evergreens should be planted late (last of May or June), but my experience has been, especially with large trees, that April is a better time than June. Unless they can be transplanted early, better postpone it to a wet time in August.

NO AGENTS. We do not employ agents or salesmen, but deal direct with the purchaser, thus avoiding misrepresentation and paying commissions, which must always be added to the first cost of the trees, when agents are employed. We can deliver heavy trees anywhere within 30 or 40 miles, much cheaper with horse teams and suitable wagons than by railroad, only charging for the time of men and horses.

PACKING. Trees and shrubs can be packed in boxes or bales, with a charge only for material used, and delivered at either depot or express office in Newburyport or Byfield, when our responsibility ceases, *Should any loss occur by delay, the forwarders alone must be held responsible*. We always send a tracer at once when notified of any such delay.

WARRANTY. We never warrant our stock to live, as we have no control over the weather or the various vicissitudes attending planting. We are always glad to advise our customers in regard to preparing and planting trees, and when our directions are carefully followed, it is very seldom that they fail to grow. We cannot either warrant our trees and plants always to be true to name and description. Mistakes will always occur in every business; but in our long experience it is very seldom that we hear any complaint. We have always been willing to replace any tree or plant that has proved untrue, but cannot be responsible further. Any mistake made in filling orders should be reported at once on receipt of stock, so we may correct it promptly.

SHIPPING. Our shipping facilities are good in all directions, especially to the East. Freight put on the cars at Newburyport at night arrives in Portland next morning, ready to be reshipped by boat or rail to any point in Maine or the Eastern Provinces. We advise to send all small packages by American Express, which connects to all parts of the country, and is very prompt and reliable.

INSECTS. We have no state entomologist in Massachusetts, but a man was sent out last season from the Agricultural College at Amherst, to examine all the nurseries in the state. He failed to find any trace of San Jose scale or other bad insects in our nurseries. I have been very careful for the last year or two not to order any stock from the infested districts. All newly-planted trees and shrubs should be looked after carefully, for it is then that insects do the most damage, and they always infest young growing trees more than older ones.

AS USUAL, six will be supplied at dozen rates, fifty at hundred, and five hundred at thousand rates.

TERMS CASH. These are our lowest prices to everyone (with no discount) except by agreement otherwise for a large or remnant lot.

REMITTANCES can be made by bank check, by American Express (prepaid), or post office order on West Newbury.

#### Fruit Trees.

\* \* \*

Our Apple Trees are 4 to 6 years from the bud—good, strong, well established trees. We have a lot older, which have not been cultivated for 2 or 3 years, that can be had for the digging. Those who want young trees of common nursery size, can be supplied from a good New England nursery, at the regular price at that nursery. Orders for such should come in early, before the digging season commences, or we cannot attend to it.

cannot attend to it.

Our Pear Trees were raised in New York state, and have been growing here from 2 to 6 years. Although not as vigorous and fresh looking as when we received them, they are perfectly acclimated, and will bear fruit several years sooner than those fresh from New York. We have also a lot of Japan Plums, planted out here one and two years, which are in the finest condition for early fruiting.

#### EVERGREENS.

8 to 10 feet..... 6 00

40 00

Our Evergreens this year are not over large, but fine, bushy trees, grown without crowding, and have all been recently transplanted. The White Spruce are extra fine, all specimens. The Picea Pungens, Picea Englemani and Abies Concolor (all Rocky Mt. trees), are as fine as can be found in the country.

| Picea Englemani and Abise Concolor (all Rocky Mt. trees), are as fine as can be found in the country.   |   |    |    |      |

## A New Hardy Weeping Willow.

ge ge ge

I would like to call attention again to our new Weeping Willow, some cuttings of which were sent in 1890 to the Nebraska State Experimental Station. It proved then to be very hardy, even more so than the common Kilmarnock and New American willows, and was so entirely different from any other that they considered it a new variety, and named it the "Thurlow Willow." I propagated and sold a few in 1895, but owing to illness the last two years, have not advertised or sold it to any extent. From what few have been sold in this vicinity, I have received very flattering testimonials, such as: "A very valuable tree," "You have a good thing," etc., and have decided to propagate and push it more in the future. On the outside is a photograph of the original tree taken in the autumn of 1895. The whole top had been taken off the spring before to be used as cuttings, but since it has all been allowed to grow, and during the last season it was a "Marvel of beauty." The top and a large part of the side branches point directly upward, while the lower limbs and small twigs point directly downward, some of them trailing on the ground. The tree stands now about 40 feet, with every prospect of its running up to be 75 feet tall.

I cannot too strongly recommend it to those who want a tall-growing weeping willow, especially to people north of us, where it is *impossible* to grow a Babylonica or other similar tree. To plant around the borders of a pond, or on the banks of rivers, it will be indispensable to produce certain landscape effects.

We have always retailed it at \$1, but to introduce it more rapidly, I have made the price very much lower (see weeping trees in this circular). If anyone at a distance would like to try it, we can cut off the tops and send with the roots for cuttings in a very compact shape. We can also send cuttings to a distance (by express) at \$2 per dozen, \$12 per 100.

The circular of 1895 is enclosed with this, which is as true now as then.

THE SPARRELL PRINT, BOSTON.

THE THURLOW WEEPING WILLOW.
From a Photograph in 1895. See Previous Page.
